GENERAL INSTRUCTIONS FOR COMPLETING SF 298

The Report Documentation Page (RDP) is used in announcing and cataloging reports. It is important that this information be consistent with the rest of the report, particularly the cover and title page. Instructions for filling in each block of the form follow. It is important to *stay within the lines* to meet optical scanning requirements.

Block 1. Agency Use Only (Leave blank).

Block 2. Report Date. Full publication date including day, month, and year, if available (e.g. 1 Jan 88). Must cite at least the year.

Block 3. Type of Report and Dates Covered. State whether report is interim, final, etc. If applicable, enter inclusive report dates (e.g. 10 Jun 87 - 30 Jun 88).

Block 4. Title and Subtitle. A title is taken from the part of the report that provides the most meaningful and complete information. When a report is prepared in more than one volume, repeat the primary title, add volume number, and include subtitle for the specific volume. On classified documents enter the title classification in parentheses.

Block 5. Funding Numbers. To include contract and grant numbers; may include program element number(s), project number(s), task number(s), and work unit number(s). Use the following labels:

C - Contract	PR - Project
G - Grant	TA - Task
PE - Program Element	WU - Work Unit Accession No.

Block 6. Author(s). Name(s) of person(s) responsible for writing the report, performing the research, or credited with the content of the report. If editor or compiler, this should follow the name(s).

Block 7. Performing Organization Name(s) and Address(es). Self-explanatory.

Block 8. Performing Organization Report Number. Enter the unique alphanumeric report number(s) assigned by the organization performing the report.

Block 9. Sponsoring/Monitoring Agency Name(s) and Address(es). Self-explanatory.

Block 10. Sponsoring/Monitoring Agency Report Number. (If known)

Block 11. Supplementary Notes. Enter information not included elsewhere such as: Prepared in cooperation with...; Trans. of...; To be published in.... When a report is revised, include a statement whether the new report supersedes or supplements the older report.

Block 12a. Distribution/Availability Statement. Denotes public availability or limitations. Cite any availability to the public. Enter additional limitations or special markings in all capitals (e.g. NOFORN, REL, ITAR).

DOD - See DoDD 5230.24, "Distribution Statements on Technical Documents."

DOE - See authorities.

NASA - See Handbook NHB 2200.2.

NTIS - Leave blank.

Block 12b. Distribution Code.

DOD - Leave blank.

DOE - Enter DOE distribution categories from the Standard Distribution for Unclassified Scientific and Technical Reports.

NASA - Leave blank.

NTIS - Leave blank.

Block 13. Abstract. Include a brief (*Maximum 200 words*) factual summary of the most significant information contained in the report.

Block 14. Subject Terms. Keywords or phrases identifying major subjects in the report.

Block 15. Number of Pages. Enter the total number of pages.

Block 16. Price Code. Enter appropriate price code (*NTIS only*).

Blocks 17. - 19. Security Classifications. Self-explanatory. Enter U.S. Security Classification in accordance with U.S. Security Regulations (i.e., UNCLASSIFIED). If form contains classified information, stamp classification on the top and bottom of the page.

Block 20. Limitation of Abstract. This block must be completed to assign a limitation to the abstract. Enter either UL (unlimited) or SAR (same as report). An entry in this block is necessary if the abstract is to be limited. If blank, the abstract is assumed to be unlimited.

Final Report
Use of GPS-Tracked Drifters to Study Water Mass
Exchange and Horizontal Dispersion near a Tidal Inlet
ONR Grant No. N00014-92-J-1793

J. H. Churchill and D. G. Aubrey
Woods Hole Oceanographic Institution
Woods Hole, MA 01543

This program involved tracking surface drifters, equipped with GPS and VHF electronics, in the waters near Beaufort Inlet, NC. The primary objectives were to effect improvements in drifter tracking technology and to study circulation and dynamics near Beaufort Inlet.

The drifter tracking operations funded by ONR were carried out in April 1993. In one part of the study, drifter were released at Beaufort Inlet during the early stages of the incoming tide. Drifter were also released at the front separating turbid water exiting the inlet from receiving shelf water. Numerous CTD measurements were acquired in order to characterize the hydrographic properties in the area of the drifters. This work was carried out in conjunction with a NOAA-funded study headed by L. Pietrafesa and D. Logan of North Carolina State University.

Among the technical concerns addressed was the limitation of VHF tracking. With the configuration employed (9-m high VHF antenna aboard the tracking vessel and a 2-watt transmitter with a 1-m whip antenna on the drifter), the tracking range was found to be line-of-sight limited. The maximum range of 16 km was sufficient for attended tracking of a small fleet of drifters. ARGOS positioning was added during times when drifters were left unattended in open water for a day or more. This capacity enabled us to return to within VHF tracking range of the drifters.

Another technical issue considered was the determination of drifter velocity from GPS positions acquired without differential correction. As part of our study of this issue, the statistical characteristics of the GPS position deviations were examined. These were found to have a root-mean-square value of 40 m and a correlation time scale of roughly 3 minutes. Velocity determination from the non-differential positions was accomplished by means of a linear regression technique. This gave highly accurate velocity estimates: typically to within 0.25 cm/s as judged by the 95% confidence intervals of the regressions. Formulae for the uncertainty limits of the computed velocities have been derived. These limits are principally constrained by the correlation time scale of the position deviations.

The technical expertise gained in this study aided the design and conduct of subsequent drifter tracking projects carried out over the northern Hatteras Shelf (as part of a MMS-funded study) and over Georges Bank (as part of the Georges Bank GLOBEC project).

Our study of the circulation near Beaufort Inlet has continued as part of the South Atlantic Bight Recruitment Experiment (SABRE). One aspect of this study has focussed on the fate of water flowing through Beaufort Inlet. The drifter tracks and companion CTD data indicate that surface water entering the inlet tends to flow eastward toward Pamlico Sound (Figure 1), a phenomenon with important implications with regard to incoming larval fish survival. The maximum tidal range of this water was found to be on the order of 12 km. Its tendency for eastward movement is partly attributed to the pressure gradient set up by the fresh water input to the estuarine system, which enters primarily to the west of the inlet. Drifter tracks, combined with current meter data, have revealed strong asymmetries in the tidal flow at Beaufort Inlet. These are accompanied by large (order 30 cm/s) and spatially varying mean flows, directed both into the estuary and seaward.

Results of this study have been presented (by Churchill) at the Mid-Atlantic Bight Physical Oceanography and Meteorology Workshop (Raleigh, November 1993) and at a WHOI seminar (Oct 1993). Some of our findings have been included in a recent masters thesis (Logan, 1995) and NOAA technical report (Logan et al., 1995a). They are detailed in a paper soon to be submitted to for peer review publication (Logan et al., 1995b).
